8. Материально-техническое обеспечение дисциплины

Компьютерный класс

Комплект учебно-методических пособий, комплект проекционного оборудования (проектор NEC V302XG, проекционный экран), 11 компьютеров: монитор LCD 20" Philips, сист. блок Intel Core i5/3,1ГГц/10Гб, клавиатура, мышь. Доступ к сети Интернет.

Лекционная аудитория

Комплект учебно-методических пособий, комплект проекционного оборудования (проектор NEC V302XG, проекционный экран), 11 компьютеров: монитор LCD 20" Philips, сист. блок Intel Core i5/3,1ГГц/10Гб, клавиатура, мышь. Доступ к сети Интернет.

Лингафонный кабинет

Комплект учебно-методических пособий; лингафонная система ЛФК-102К на 16 посадочных мест и 1 место преподавателя, гарнитура ТМГ – 17 штук; компьютер Spark (монитор LCD Aser 21,5", сист. блок Intel Core i3/3,4ГГц/4Гб/DVD-RW, клавиатура, мышь), комплект проекционного оборудования (проектор Benq MX532, проекционный экран). Доступ к сети Интернет.

9. Методические указания по освоению дисциплины

На практических занятиях изученный теоретический материал отрабатывается и закрепляется посредством выполнения заданий по темам. Занятия проводятся в кабинете английского/немецкого языка. Работа со студентами может быть фронтальной, индивидуальной или в группах: выполняются различные языковые задания.

В конце каждого этапа работы обучающиеся демонстрируют полученные результаты и работают над ошибками.

Обучающиеся сами определяют режим своей самостоятельной работы и меру труда, затрачиваемого на овладение учебным содержанием дисциплины. Они выполняют внеаудиторную работу и изучение материалов, выносимых на самостоятельную работу, по личному индивидуальному плану, в зависимости от уровня его подготовки, времени и иных условий.

Форма заключительного контроля при промежуточной аттестации – зачет с оценкой. Для проведения промежуточной аттестации по дисциплине разработаны фонд оценочных средств и балльно-рейтинговая система оценки учебной деятельности студентов. Оценка по дисциплине выставляется в информационной системе и носит интегрированный характер, учитывающий результаты оценивания участия студентов в аудиторных занятиях, качества и своевременности выполнения заданий в ходе изучения дисциплины и промежуточной аттестации.

SAFETY

1. Safety is concerned with those activities that seek either to minimise or to eliminate hazardous conditions that can cause bodily injury. Safety precautions fall under two principal headings, occupational safety and public safety. Occupational safety is concerned with risks encountered in areas where people work: offices, manufacturing plants, farms, construction sites, and commercial and retail facilities. Public safety involves hazards met in the home, in travel and recreation, and other situations not falling within the scope of occupational safety.

2. Safety was not considered to be a matter of public concern in ancient times, when accidents were regarded as inevitable or as the will of the gods. Today the concern for safety is world-wide and is the province of numerous governmental and private agencies at the local, national, and international levels.

3. Several international organisations provide means by which national safety organisations can exchange information and pass on new ideas. Among them are the International Social Security Association (ISSA) and the International Labour Organisation (ILO). A number of organisations, including the ILO, ISSA, the World Health Organisation, and the European Economic Community, maintain a joint information bureau in Geneva. The International Organisation for Standardisation, which is also based in Geneva, helps establish safety codes and standards for numerous areas of activity among the many nations that sponsor it.

4. Among the chief activities of individuals and organisations concerned with safety are the collection of statistics on accidents and injuries and the publication of analyses of those statistics; the study of hazardous situations and environments and the development of safer designs, procedures, and materials; the development of educational programs for employers, workers, drivers, and other groups at risk; and the design of machines, workplaces, and safety equipment that minimize the risk of injury

AUTOMATION

1. Automation is the application of machines to tasks once performed by human beings or to tasks that would otherwise be impossible. Although the term mechanization is often used to refer to the simple replacement of human labour by machines, automation generally implies the integration of machines into a self-governing system. There is scarcely an aspect of modern life that has been unaffected by automation.

2. The term automation appeared in the automobile industry about 1946 to describe the increased use of automatic devices and controls in mechanized production lines. The term is used widely in a manufacturing context, but it is also applied outside manufacturing in connection with a variety of systems in which there is a significant substitution of mechanical, electrical, or computerized action for human effort and intelligence.

3. Automation can be defined as a technology concerned with performing a process by means of programmed commands combined with automatic feedback control to ensure proper execution of the instructions. The resulting system is capable of operating without human intervention. The development of this technology greatly depends on the use of computers and computer-related technologies. Consequently, automated systems are becoming more sophisticated and complex.

4. Automation technology has matured to a point where a number of other technologies have developed from it and have achieved a recognition and status of their own. Robotics is one of these technologies. It is a specialized branch of automation in which the automated machine possesses certain humanlike characteristics. The most typical humanlike characteristic of a modern industrial robot is its powered mechanical arm. The robot's arm can be programmed to perform useful tasks, such as loading and unloading parts at a production machine or making a sequence of spot-welds on the sheet-metal parts of an automobile body during assembly.

EFFICIENCY IN ENGINEERING OPERATIONS

1. To solve an engineering problem means to find a proper solution having taken into account the user's needs and conflicting requirements of the production process.

Efficiency costs money, safety adds complexity, performance increases weight. An engineering solution is to be the optimum based on many factors: it should be the cheapest for a given performance, the most reliable for a given weight, the simplest for given safety or the most efficient for a given cost. In other words engineering means performance optimisation.

2. The rate of efficiency is calculated according to «output divided by input» formula: one should secure a maximum output for a given input or to secure a given output for a minimum input. Efficiency is achieved by using efficient methods, devices, and personnel organisations. The efficiency ratio may be expressed in terms of energy, materials, money, time or men.

The processing of new antibiotics in the test-tube stage belongs to the field of biochemistry science. One of the main engineering problems is to start the efficient process of their manufacturing but the need for efficiency brings about the introduction of complicated engineering operations.

The efficiency factor also helps to differentiate ceramic engineering from the work of the potter, textile engineering from weaving, and agricultural engineering from farming.

3. Since output is input minus losses, the engineer must keep losses and wastes to a minimum having developed methods for waste products to be properly utilised. Losses due to friction can occur: in any machine or system. Efficient functioning depends on a good design, lubrication facilities and careful attention to operating difficulties.

4. The raw materials, engineers have to work with, are not often found in useful forms. Engineering is required to conceive, design and convert energy of a mountain stream into the powerful torque an electric motor. Similarly, many engineering operations are required to change the seashore sands into precise lenses to observe the microscopic amoeba in a drop of water. In a certain sense, the successful engineer is a person who is able to improve things.

ENGINEERING

1. Engineering is the design, analysis, and/or construction of works for practical purposes. The history of the concept of "engineering" stems from the earliest times when humans began to make clever inventions, such as the pulley, lever, or wheel, etc. The exact etymology of the word engineer, however, is a person occupationally connected with the study, design, and implementation of engines. The word "engine" means "innate quality, especially mental power, hence a clever invention". Thus, an engineer, essentially, is someone who makes useful or practical inventions. From another perspective, a now obsolete meaning of engineer is "a constructor of military engines". Engineering was originally divided into military engineering, which included construction of fortifications as well as military engines, and civil engineering, non-military construction of such as bridges.

2. With the rise of engineering as a profession in the nineteenth century the term became more narrowly applied to fields in which mathematics and science were applied to these ends. Similarly, in addition to military and civil engineering the fields then known as the mechanic arts became incorporated into engineering. Now the broad discipline of engineering encompasses a range of specialized subdisciplines.

3. Engineering is a subject that ranges from large collaborations to small individual projects. Almost all engineering projects are beholden to some sort of financing agency: a company, a set of investors, or a government. The few types of engineering that are minimally constrained by such issues are pro bono engineering and open design engineering.

4. By its very nature engineering is bound up with society and human behavior. Every product or construction used by modern society will have been influenced by engineering design. Engineering design is a very powerful tool to make changes to environment, society and economies, and its application brings with it a great responsibility.

- 1) In the 19th century the mechanical arts gave birth to mechanical engineering.
- 2) In the 19th century due to the development of mathematics and science there appeared nuclear engineering.
- 3) Chemical engineering as a separate branch of engineering appeared in the 19th century.
- 4) In the 19th century the achievements in the fields of mathematics and science resulted in the development of space engineering.

4. Определите основную идею текста.

ENVIRONMENTAL ENGINEERING

1. Environmental engineering is the application of science and engineering principles to improve the environment (air, water, and/or land resources), to provide healthy water, air, and land for human habitation and for other organisms, and to remediate polluted sites. Environmental engineering involves water and air pollution control, recycling, waste disposal, and public health issues. It also includes studies on the environmental impact of proposed construction projects.

2. Environmental engineers conduct hazardous-waste management studies to evaluate the significance of the such hazards, advise on treatment and containment, and develop regulations to prevent mishaps. Environmental engineers also design municipal water supply and industrial wastewater treatment systems as well as being concerned with local and worldwide environmental issues such as the effects of acid rain ozone depletion, water pollution and air pollution from automobile exhausts and industrial sources.

3. Ever since people first recognized that their health and well-being were related to the quality of their environment, they have applied thoughtful principles to attempt to improve the quality of their environment. Modern environmental engineering began in London in the mid-19th century when it was realized that proper sewerage could reduce the incidence of waterborne diseases

such as cholera. The introduction of drinking water treatment and sewage treatment in industrialized countries reduced waterborne diseases from leading causes of death to rarities.

4. Conservation movements and laws restricting public actions that would harm the environment have been developed by various societies for millennia. Notable examples are the laws decreeing, the construction of sewers in London and Paris in the 19th century and the creation of the US national park system in the early 20th century.

How Batteries Work

1. An electrical battery is a combination of one or more electrochemical cells, used to convert stored chemical energy into electrical energy. Since the invention of the first Voltaic pile in 1800 by Alessandro Volta, the battery has become a common power source for many household and industrial applications.

2. Inside the battery itself, a chemical reaction produces the electrons. The speed of electron production by this chemical reaction (the battery's internal resistance) controls how many electrons can flow between the terminals. Electrons flow from the battery into a wire, and must travel from the negative to the positive terminal for the chemical reaction to take place. That is why a battery can be stored on a shelf for a year and still have plenty of power. Once you connect a wire, the reaction starts.

3. Batteries may be used once and discarded, or recharged for years as in standby power applications. Miniature cells are used to power devices such as hearing aids and wristwatches; larger batteries provide standby power for telephone exchanges or computer data centers.

1. Определите, какое утверждение соответствует содержанию текста.

1) People use batteries because they don't have an alternative source of power.

2) The capacities of batteries surpass other energy sources.

3) The conversion of chemical energy into electrical makes batteries the source of power.

4) Batteries are a comparatively new source of energy.

2. Завершите утверждение согласно содержанию текста.

1) people's careful service

2) the possibility of its recharging

3) the peculiarity of chemical reaction taking place inside them

4) their stored power

Why do people use batteries?

1) People use batteries to meet their personal needs.

2) Batteries represent a potential source of energy.

3) Batteries are used for many industrial and household applications.

4. Определите основную идею текста.

1) Battery represents a potential energy source as it can be stored for some time and still be powerful.

2) People can't do without batteries nowadays as they are used to power some important devices.

MACHINE TOOLS

1. Machine tools are a class of powered equipment, usually installed in a fixed location in contrast to portable power tools. Machine tools typically have powerful electric motors producing rotational motion or hydraulic force. They often employ cutting surfaces. Machinery equipped with belts, flywheels, chain drives, cranks, connecting rods, and shafting must be equipped with guards to protect employees from the moving parts,

2. Machine tools are capable of causing amputations and other serious personal injury. Also, some machine tools use a lubricant to cool the working surface. This coolant is a potential source of injury and illness in that a spill could be a slip hazard, and bacteria can grow in the fluid mixture. Cutting oils present other health and environmental hazards, but they are used in certain types of machine tools.

3. Because the mechanical transmission of power is frequently associated with machine tools, the general subject of safety guards also needs addressing. You can avoid the hazards associated with

machine tools by standing outside of the work area. If you have business to conduct in the area, wear appropriate eye protection and remain a safe distance away from the machinery. However, for those who run the machinery there is a number of special rules.

4. Here are some efficient responsibilities for a machine operator. Do not attempt to use the machine tools unless you have been trained and are so authorized by your supervisor and the appropriate machine shop supervisor. Inspect and ensure that all required machinery is working properly before use. Wear prescribed personal protective clothing and equipment. Use the proper tool or blade for the job and the material you are working with. Do not get distracted from the work in progress. Keep hands away from pinch points and cutting surfaces. All machinery that can "walk" or tip over from vibration must be secured to the floor.

3. Ответьте на вопрос.

What should those who have to conduct business in the machinery work area do?

- 1) They only should stand outside of the work area; eye protection is not necessary.
- 2) They should undergo a special training performed by the supervisor; then they are freely allowed to the work area.
- 3) They should remain a safe distance away from the machinery and wear appropriate eye protection.
- 4) They should not approach the work area and keep a five-meter safety distance.

4. Определите основную идею текста.

- 1) Machine tools and in particular their cutting surfaces and cooling fluids present a potential hazard for health and environment.
- 2) All kinds of machinery must be equipped with guards to protect employees from the moving parts.
- 3) Described as powered equipment with cutting surfaces capable of causing serious personal injuries, machine tools require only specially trained workers with self-protective means to operate them.
- 4) Those who would like to run the machinery should undergo special training.

MACHINES

1. Machine is a device, having a unique purpose, that replaces human or animal effort for the accomplishment of physical tasks. This broad category encompasses such simple devices as the lever, wedge, wheel and axle, pulley, and screw as well as such complex mechanical systems as the modern automobile. The operation of a machine may involve the transformation of chemical, thermal, electrical, or nuclear energy into mechanical energy, or vice versa, or its function may simply be to modify and transmit forces and motions.

2. All machines have an input, an output, and a transforming or modifying and transmitting device. Machines that receive their input energy from a natural source, such as air currents, moving water, coal, petroleum, or uranium, and transform it into mechanical energy are known as prime movers. Windmills, waterwheels, turbines, steam engines, and internal-combustion engines are prime movers. In these machines the inputs vary; the outputs are usually rotating shafts capable of being used as inputs to other machines, such as electric generators, hydraulic pumps, or air compressors.

3. All three of the latter devices may be classified as generators; their outputs of electrical, hydraulic, and pneumatic energy can be used as inputs to electric, hydraulic, or air motors. These motors can be used to drive machines with a variety of outputs, such as materials processing, packaging, or conveying machinery, or such appliances as sewing machines and washing machines. All machines of the latter type and all others that are neither prime movers, generators, nor motors may be classified as operators.

4. This category also includes manually operated instruments of all kinds, such as calculating machines and typewriters. In some cases, machines in all categories are combined in one unit. In a diesel-electric locomotive, for example, the diesel engine is the prime mover, which drives the electric generator, which, in turn, supplies electric current to the motors that drive the wheels.

ON THE DEVELOPMENT OF TECHNOLOGY

1. The use of technology began with the conversion of natural resources into simple tools. The prehistorical discovery of the ability to control fire increased the available sources of food, and the invention of the wheel helped humans in travelling and controlling their environment. Recent technological developments, including the printing press, the telephone, and the Internet, have lessened physical barriers to communication and allowed humans to interact on a global scale.

2. Not all technology, however, has been used for peaceful purposes; the development of weapons of ever-increasing destructive power has progressed throughout history, from clubs to nuclear weapons. Technology has affected society and its surroundings in a number of ways. In many societies, technology has helped develop more advanced economies (including today's global economy) and has allowed the rise of a leisure class.

3. Nevertheless, it is a well-known fact that many technological processes produce unwanted by-products, known as pollution, and deplete natural resources, to the detriment of the Earth and its environment. Various implementations of technology influence the values of a society and new technology often raises new ethical questions. Examples include the rise of the notion of efficiency in terms of human productivity, a term originally applied only to machines, and the challenge of traditional norms.

4. Philosophical debates have arisen over the present and future use of technology in society, with disagreements over whether technology improves the human condition or worsens it. Neo-Luddism and similar movements criticise the global penetration of technology into the modern world, claiming that it alienates people and destroys culture; proponents of ideologies such as transhumanism and techno-progressivism view continued technological progress as beneficial to society and the human condition.

What do we mean when we speak about the undesirable by-products of some technological processes?

1) The development of weapons of high destructive power.

2) Changes in the values of the society.

3) The pollution of the environment and the depletion of natural resources.

4) The development of global economy.

4. Определите основную идею текста.

1) The development of technology resulted in the application of the term "efficiency" not only to machines, but also to people.

2) The development of technology causes both negative and positive consequences.

3) The development of technology follows the development of society.

4) It is impossible to use technology only for peaceful purposes.

Plasma Cutters

1. Modern industry depends on the manipulation of heavy metal and alloys. We need metals to build the tools and transportation necessary for day-to-day business. The reason is simple: metals are extremely strong and durable, so they're the logical choice for most things that need to be especially big, especially sturdy or both.

2. The funny thing is that metal's strength is also a weakness: because metal is so good at resisting damage, it's very difficult to manipulate and form into specialized pieces. People can precisely cut and manipulate the metals using the plasma cutter. The plasma cutter is actually a common tool that has been around since World War II.

3. Plasma cutters are not the only devices to harness the power of plasma. Neon signs, fluorescent lighting and plasma displays, just to name a few, all rely on it to get the job done. These devices use "cool" plasma. Though cool plasma cannot be used to cut metals, it has tons of other useful applications.

1. Определите, какое утверждение соответствует содержанию текста.

- 1) "Cool" plasma is a device which is applied for illumination.
- 2) Plasma cutter uses all the best possibilities of plasma.
- 3).The drawback of metal is in its difficulty to be manipulated and formed into specialized pieces.
- 4) People use metals in building tools and transportation as they are easy to work with.

2. Завершите утверждение согласно содержанию текста.

Modern industry relies on plasma cutters as ...

- 1) plasma has a great many applications
- 2) metals are the most frequently used material in industry
- 3) they are common tools to manipulate with metals
- 4) they are the most effective devices in manipulating with metals and their alloys.

3. Ответьте на вопрос.

How is the effectiveness of plasma used in industry?

- 1) Metals can be manipulated both by plasma cutters and "cool" plasma.
- 2) In spite of having good characteristics metals' drawback is in being manipulated primarily by plasma cutters.
- 3).Due to plasma cutters metals can be manipulated and formed.
- 4). Plasma cutter is irreplaceable for manipulations with metals and "cool" plasma can be used for illumination.

4. Определите основную идею текста.

- 1) It would be impossible to manipulate with metals without plasma cutters.
- 2) Plasma cutters are not the only devices to harness the power of plasma.
- 3) Plasma is the latest achievement in industry designating for metals manipulations.
- 4) Modern industry relies on plasma as it has a lot of valuable applications.
